Digital And Analog Communication Systems

Definition: Analog and digital communications are the two types of data transmission system however several factors generate the difference between the two. The major difference between analog and digital communication lies in the signal being transmitted. In analog communication, the message signal is in analog form i.e., continuous time signal.

In fact analog and digital communication is very intresting. The Schaum's Guide and the text written by B P Lathi are both excellently written and develops an appreciation and intrest for analog and digital communication. Couch's text, however is the worst that I have seen written on the subject. The first problem with Couch's text is the ...

Following are the sections of the digital communication system. Source. The source can be an analog signal. Example: A Sound signal. Input Transducer. This is a transducer which takes a physical input and converts it to an electrical signal (Example: microphone). This block also consists of an analog to digital converter where a digital signal is needed for further processes.
